Backend-Leaning Fullstack Engineer — NestJS · Next.js · TypeScript · PostgreSQL · AWS Certified Cloud Practitioner

SUMMARY

I build backend systems that are meant to last — clean architecture, typed APIs, and deployments that don't require babysitting. Most of my recent work has been in NestJS and TypeScript, with real-time features via WebSockets and self-managed infrastructure on Linux. I'm looking for a junior or intermediate backend or fullstack role where I can work on a real enterprise product and improve my backend and fullstack skill.

EXPERIENCE

Independent Fullstack Engineer — BKLM CBT

Jan 2026 – Present

Custom EdTech Assessment Platform for Educational Counselors (BK teacher)

Remote

- Developed a modular backend API using NestJS and PostgreSQL, enforcing strict separation of concerns to ensure system maintainability during rapid feature expansion.
- Added real-time session sync using WebSockets; fixed a race condition that caused exam state to drift between clients under concurrent load by routing updates through a Redis buffer/consumer instead of processing them directly.
- Set up the full deployment pipeline (Docker, Nginx, CI/CD via GitHub Actions) on a self-hosted Proxmox server running on a repurposed laptop, with an Ansible playbook to provision server access as part of the pipeline, and Cloudflare Tunnel exposing the app publicly — cutting hosting cost to just an domain fee (\$2/year) instead of recurring VPS costs.
- Built the frontend in Next.js, using TanStack Query for client-side caching and state management to reduce redundant requests, with AI-assisted development used selectively and verified manually rather than relying on it fully.

Fullstack Engineer Intern

Jun 2024 – Oct 2024

PT Ramu Prima Persada — Construction & IT Consultancy

Bandung, Indonesia

- Built a web-based construction monitoring system in PHP/MySQL to track project milestones and resource allocation for the internal ops team.
- Automated the reporting pipeline — what used to take manual aggregation now runs on a script, cutting the effort by around 80%.

PROJECTS

CV Translation Automation Tool | Go, LibreTranslate (self-hosted)

Feb 2026 – Mar 2026

- Built a one-click browser extension to automate translating student CVs into Japanese, replacing a manual copy-paste-between-tools workflow for a friend handling the translations.
- Integrated a self-hosted LibreTranslate instance via REST, with a lightweight SvelteKit confirmation form to verify Japanese translation accuracy before triggering PDF export.
- Deployed and verified live on a personal VPS; taken offline after initial use pending further requirements.

Web Security & Performance Research | Python, Flask, SQLite, Prometheus, Grafana

Jan 2025 – Jul 2025

- Set up automated log collection and built custom Grafana dashboards to monitor real-time hardware and app metrics.
- Tested the impact of API rate limiting and RBAC on a Flask server under simulated load — Prometheus metrics showed a measurable drop in CPU usage.

Student Attendance Backend | Java, Spring Boot, WebSocket, MySQL | Bootcamp — Arutala

May 2025 – Jul 2025

- Completed as part of a structured bootcamp program (Arutala), building REST API endpoints with Spring Boot and Spring Data JPA for attendance record validation and data integrity.
- Implemented real-time check-in event push to the admin client via WebSocket.

EDUCATION

Politeknik Negeri Bandung

Bandung, Indonesia

Applied Bachelor of Computer Science (D4 Teknik Informatika)

Aug 2020 – Aug 2025

TECHNICAL SKILLS

Core Languages: TypeScript, JavaScript, SQL, Python, Go

Backend: NestJS, Node.js, Spring Boot, Flask — REST, WebSocket, Redis, Prisma, Spring Data JPA

Databases: PostgreSQL, MySQL, SQLite

Infrastructure: Docker, Nginx, Ansible, Proxmox VE, Cloudflare Tunnels, Linux (Ubuntu/Debian)

Cloud & Tooling: AWS Certified Cloud Practitioner · Git · Prometheus · Grafana

Frontend (supporting): React, Next.js, SvelteKit
